

Contact Us Form Directions

Using the attached PSD (or image if you cannot open the PSD) as a guide for the layout and design, create a working contact us form. Please make the form usable on both desktops and mobile devices (aka responsive). How many breakpoints you want to create is up to you, but only mobile and desktop are required. Design for smaller devices is completely up to your interpretation.

You are also free to use as many libraries as you need and won't be penalized for inclusion of large files (example: including the entire jQuery library to do a simple animation)

Please provide us with a minimum of two files: a PHP file for displaying and processing the form, and a separate CSS file containing the style rules for the form. You should also provide any images you use to make the form look like the PSD.

We should be able to extract your files to a web server and submit the form.

The PHP code should:

- Provide minimal form validation to ensure that each form field is filled out. No additional validation is necessary.
- When the form is not filled out correctly, an error message should be displayed.
- When the form is filled out correctly, a thank you message should be displayed and the data from the form should be emailed to an email address (any address is fine for testing) and inserted into a MySQL database table. The SQL for creating the table is provided below:

```
CREATE TABLE IF NOT EXISTS `contact_us` (  
    `id` int(11) NOT NULL AUTO_INCREMENT,  
    `name` varchar(255) NOT NULL,  
    `email` text,  
    `message` text,  
    UNIQUE KEY `id` (`id`)  
) ENGINE=MyISAM DEFAULT CHARSET=latin1;
```

A starter contact-us.php file and the required design and asset files are attached.

Please let us know if you have any questions.

Thank you!
